Report Overview

Flexible Jaw Couplings are mechanical components used in various industrial applications to connect and transmit power between two rotating shafts. They are designed to accommodate misalignment, absorb shock loads, and dampen vibrations, thereby enhancing the efficiency and longevity of the connected machinery. These couplings typically consist of two halves, each with a jaw-like structure that clasps onto the respective shaft ends. The jaws are made from a flexible material, such as rubber or a polymer, which allows for a certain degree of movement and flexibility. The couplings are engineered to maintain a secure connection even under fluctuating loads and varying operating conditions, making them a reliable choice for power transmission in diverse environments.
