Abstracts

Fluorescence dissolved oxygen (DO) sensors, also known as fluorescence quenching sensors, are devices that measure the concentration of dissolved oxygen in liquids using the principle of fluorescence quenching. These sensors utilize a fluorescent dye that emits light when excited by a specific wavelength. The presence of dissolved oxygen quenches the fluorescence, and the extent of quenching is proportional to the oxygen concentration. This technique provides a non-invasive and highly accurate method for determining DO levels.

The global Fluorescence Dissolved Oxygen Sensors market size was estimated at USD 185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
