Abstracts

In the process of aluminum smelting, as aluminum is an active metal, the method of electrolytic melting of alumina is usually used for smelting. However, direct electrolytic melting of alumina requires a large amount of electrical energy and is not efficient. In order to improve electrolysis efficiency and reduce energy consumption, fluoride salts (such as aluminum fluoride and cryolite) are often added in industry. Fluoride salts mainly play two roles in the process of electrolyzing molten alumina: firstly, they lower the melting point of alumina, allowing the electrolysis process to proceed at lower temperatures, thereby saving energy; Secondly, as a component of the electrolyte, it participates in electrolysis reactions and improves electrolysis efficiency.

The global Fluorinated Salts For Electrolytic Aluminum market size was estimated at USD 850.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
