Report Overview

Fly ash is a fine, powdery byproduct of coal combustion in thermal power plants, primarily composed of silica, alumina, and iron oxide. It is widely used as a supplementary cementitious material in construction due to its pozzolanic properties, which enhance the strength and durability of concrete while reducing the need for Portland cement. The material is categorized into Class F and Class C based on its chemical composition, with Class F being low in calcium and derived from burning anthracite or bituminous coal, while Class C contains higher calcium content and is produced from sub-bituminous or lignite coal. Its use in construction supports sustainability by repurposing industrial waste, lowering carbon emissions associated with cement production, and improving concrete workability, permeability, and long-term performance. The market for fly ash is driven by infrastructure development, green building initiatives, and stringent environmental regulations promoting waste recycling. However, supply fluctuations due to declining coal-based power generation and competition from alternative materials like slag cement and silica fume pose challenges to market growth.
