Abstracts

Focused ion beam technology (FIB) is an advanced nano-processing method. It generates ion beams through a liquid metal ion source (such as gallium, Ga), accelerates and focuses the ion gun, and acts on the sample surface. It uses physical collision to achieve processing purposes such as cutting, etching, deposition, and ion implantation. Focused ion beam technology can achieve nano-level processing accuracy. The current commercial model has a maximum image resolution of 4nm, which makes it have extremely high application value in the fields of microelectronics, nanomaterials, etc. This report only counts companies that provide focused ion beam technology services. Focused ion beam technology is widely used in semiconductor manufacturing, microelectronic device preparation, nanomaterial synthesis and other fields. Especially in the semiconductor industry, ion beam technology is used in the etching, ion implantation, surface modification and other processes of semiconductor materials to realize the preparation of integrated circuits. In addition, with the continuous emergence of new materials such as two-dimensional materials and nanomaterials, the demand for the precise processing of these new materials by focused ion beam technology is also growing. In summary, the focused ion beam technology market shows a steady growth trend and has broad application prospects and investment potential.
