Abstracts

Focused ultrasound ablation is an advanced non-invasive or minimally invasive treatment technology. Focused ultrasound ablation uses the directionality, penetrability and focusing characteristics of the ultrasound beam to focus the low-energy ultrasound emitted from the body on the lesion site in the body. At the focus, the ultrasound energy is converted into heat energy, causing the local tissue temperature to rise rapidly to above 60°C, and may even reach 100°C. This high temperature effect causes coagulative necrosis of the lesion tissue, thereby achieving the purpose of treatment.

The global Focused Ultrasound Ablation Surgery market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.60% during the forecast period.
