Report Overview

Food grade bleaching earth, also known as activated clay or bleaching clay, is a highly processed adsorbent material derived from natural clay minerals, primarily bentonite or montmorillonite, treated with acids or other activating agents to enhance its adsorptive properties. It is widely used in the edible oil refining industry to remove impurities such as pigments, phospholipids, oxidation products, and trace metals, thereby improving the oil's color, odor, and stability. Its effectiveness in purifying oils without altering their nutritional value makes it a critical component in the production of high-quality edible oils, including soybean, palm, sunflower, and canola oils. The demand for food grade bleaching earth is driven by the growing food processing industry, stricter food safety regulations, and increasing consumer preference for refined and visually appealing edible oils. The market is further influenced by innovations in bleaching earth formulations to enhance efficiency and sustainability, as well as the expansion of oil production in emerging economies.
