### Report Overview

Form-in-Place (FIP) EMI Gaskets are a type of electromagnetic interference shielding solution used in electronic devices and systems to prevent electromagnetic radiation from escaping or entering the device. These gaskets are made from conductive materials, such as silicone or elastomers, and are designed to be applied directly onto the surface of the device, filling gaps and seams to create an effective barrier against EMI. The FIP EMI Gaskets are customizable in shape and size, allowing for precise fitting to the specific contours of the device. They are cured in place, either through heat or UV light, providing a reliable and long-lasting seal. This technology is particularly useful in applications where traditional pre-molded gaskets may not fit perfectly or where dynamic sealing is required, such as in automotive, aerospace, and military electronics, where robustness and reliability are crucial.
