Abstracts

Free circulating tumor cell detection is a method of isolating and detecting tumor cells from the patient's peripheral blood. These tumor cells fall off from primary or metastatic tumors and enter the blood circulation. CTC detection technology captures these cells through physical or biomarker methods for early diagnosis, efficacy monitoring, recurrence warning and prognosis evaluation of cancer. This non-invasive test can provide tumor characteristic information, help personalized treatment and dynamically track disease progression.

The global Free Circulating Tumor Cell Detection market size was estimated at USD 125.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.85% during the forecast period.
