### Report Overview

A Full Wave Bridge Rectifier is an electronic component used to convert alternating current (AC) into direct current (DC). It consists of four diodes arranged in a bridge configuration, with two diodes connected in series and parallel to the other two, forming a bridge-like structure. The input AC signal is applied across the two opposite corners of the bridge, and the output DC signal is taken from the other two corners. The rectifier works by allowing current to flow in one direction through the diodes during the positive half of the AC cycle and in the opposite direction during the negative half, effectively converting the entire AC waveform into a pulsating DC waveform. This type of rectifier is more efficient than a half-wave rectifier, as it utilizes both halves of the AC input, resulting in a higher average output voltage and lower ripple voltage. Full Wave Bridge Rectifiers are commonly used in power supplies, electronic circuits, and various other applications where AC-to-DC conversion is required.
