Abstracts

A fully automatic atomic force microscope (AFM) is a sophisticated scientific instrument used for imaging and manipulating matter on a nanoscale level. It combines the principles of scanning probe microscopy with advanced automation capabilities. An AFM operates by scanning a tiny, sharp probe tip across the surface of a sample. The tip, much smaller than a human hair, interacts with the atoms and molecules on the surface, generating a three-dimensional map of the sample's topography. This allows scientists to examine surface features and measure properties such as rough, hardness, and electrical conductivity.

The global Fully Automatic Atomic Force Microscope market size was estimated at USD 320.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
