Report Overview

Gadolinium-153, also known as Gd-153, is a radioactive isotope of the element gadolinium, which has an atomic number of 64. This isotope has a half-life of approximately 241 days, making it suitable for use in medical applications, particularly in targeted radionuclide therapy. In such therapies, Gd-153 can be used to emit gamma radiation, which can be directed towards cancerous cells to destroy them while minimizing damage to surrounding healthy tissues. The isotope's relatively long half-life allows for a controlled release of radiation, which can be advantageous in treatment planning and dosimetry. Additionally, Gd-153 can be used in nuclear medicine for diagnostic purposes, such as imaging, due to its ability to emit gamma rays that can be detected by gamma cameras. Overall, Gd-153 is a versatile isotope with significant potential in the field of nuclear medicine, offering both therapeutic and diagnostic applications.
