### Report Overview

Gallium Selenide (GaSe) crystals are a type of layered semiconductor material with unique optoelectronic properties, including high nonlinear optical coefficients, broad transparency in the infrared (IR) range, and strong birefringence. These characteristics make GaSe crystals highly suitable for applications in nonlinear optics, terahertz (THz) wave generation, photodetectors, and frequency conversion devices. The material's anisotropic structure allows for efficient phase matching in nonlinear optical processes, while its wide bandgap (~2.1 eV) and low thermal conductivity influence its performance in high-power laser applications. GaSe is also notable for its mechanical exfoliation capability, enabling the production of thin films for advanced optoelectronic and photonic devices. However, challenges such as susceptibility to moisture degradation and difficulty in large-scale crystal growth limit its widespread commercial adoption. The market for GaSe crystals is primarily driven by research institutions, defense applications, and specialized industrial sectors requiring high-performance IR and THz technologies.
