Report Overview

A Gamma Probe System is a sophisticated medical device used primarily in nuclear medicine and surgical procedures. It is designed to detect and measure gamma radiation emitted by radioactive isotopes, particularly those used in diagnostic and therapeutic applications. The system typically consists of a handheld probe or a surgical tool integrated with a radiation detector, which can be used to locate and quantify the presence of radioactive materials within the body. This technology is crucial in procedures such as sentinel lymph node biopsy, where it helps surgeons identify and remove the first lymph nodes that receive drainage from a tumor, as well as in targeted radionuclide therapy, where it assists in the precise delivery of radioactive substances to cancerous cells. The Gamma Probe System enhances surgical accuracy, reduces the risk of complications, and contributes to better patient outcomes by providing real-time, intraoperative feedback on the distribution and concentration of radioactive tracers.

In 2024, the global Gamma Probe System market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
