Abstracts

GaN Wafer Defect Inspection System refers to a specialized equipment or system used for inspecting and detecting defects on Gallium Nitride (GaN) wafers. GaN is a wide-bandgap semiconductor material that is commonly used in the production of high-power and high-frequency electronic devices, such as power amplifiers, LEDs, and radio frequency (RF) devices. The GaN Wafer Defect Inspection System is designed to analyze the quality and integrity of GaN wafers by identifying and characterizing various types of defects, such as crystal defects, dislocations, cracks, contaminants, and other imperfections. This system typically utilizes advanced imaging techniques, such as optical microscopy, scanning electron microscopy (SEM), atomic force microscopy (AFM), and other non-destructive testing methods. By detecting and analyzing defects at an early stage, manufacturers can identify problematic wafers and take corrective measures to improve the yield and performance of their products. Additionally, this system helps in the research and development of new GaN-based technologies by providing valuable insights into the material properties and defect characteristics.

The global Gan Wafer Defect Inspection System market size was estimated at USD 425.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
