## Abstracts

Gang drilling is performed with a dedicated gang drilling machine. A gang drilling machine is a type of lathe that specializes in gang drilling holes. While general lathes rotate the material, hole drilling by gang drilling machines is performed by rotating the gang drills. In deep hole drilling, chips generated by the drilling process can block the drilled hole or interfere with the drill's rotation, resulting in damage to the drill. As a countermeasure, cutting oil is continuously injected from the tip of the drill to create a flow of cutting oil inside the drilled hole, which pushes chips backward out of the hole. The gang drill has a holding section at the base of the drill, called a screwdriver, which is held by the rotating chuck of the gang drilling machine. Cutting fluid is supplied from the rear of the driver, passes through the shank of the gang drill, and is sprayed from the cutting edge at the tip of the drill. For this reason, gang drilling machines are characterized by the center-through coolant function (function to supply cutting oil) in the part that holds the driver. Depending on the machining depth, the length of a gang drill can be dozens of times longer than its diameter. The depth of drilling causes runout of the shank (shaft) of the gang drill, and several guides are provided on the gang drilling machine to suppress this runout. The number of guides used can be selected according to the hole depth, and the guides move without interfering with machining.

The global Gang Drilling Machine market size was estimated at USD 6478.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
