### Report Overview

Gantry Friction Stir Welding (FSW) is an advanced, solid-state welding process that utilizes a non-consumable tool to join materials without the need for filler material or shielding gases. The process involves a rotating tool with a pin and shoulder that is plunged into the joint of the materials to be welded. The frictional heat generated by the tool's rotation and the relative motion between the tool and the workpiece material cause the materials to soften and plasticize, allowing them to be forged together under the pressure exerted by the tool's shoulder. This method is particularly effective for joining materials such as aluminum, steel, and other metals that are difficult to weld using traditional fusion welding techniques. Gantry FSW systems are often employed in industries such as aerospace, automotive, and rail manufacturing, where high-quality, defect-free welds are critical for the performance and safety of the final product.
