Report Overview

A Gas Diffusion Layer (GDL) for fuel cells is a critical component in the design and operation of fuel cell systems. It is a porous, non-woven fabric that serves multiple functions essential to the efficient performance of the fuel cell. The GDL facilitates the transport of reactant gases (typically hydrogen and oxygen) to the catalyst layer, where the electrochemical reactions occur. It also helps in the removal of water and heat generated during the reaction, maintaining the optimal operating conditions for the fuel cell. The GDL is designed to be electrically conductive to minimize resistance losses and to provide mechanical support to the membrane electrode assembly. Its structure is engineered to balance gas permeability, liquid water management, and electrical conductivity, which are crucial for the overall efficiency and longevity of the fuel cell.
