Report Overview

A Gas Dynamic Vacuum Gauge is a specialized type of vacuum gauge designed to measure low pressure or vacuum levels in various industrial and scientific applications. It operates on the principle of gas dynamics, utilizing the flow of gas through a constricted orifice to determine the pressure difference between the vacuum chamber and the atmospheric pressure. The gauge typically consists of a nozzle, a diffuser, and a pressure sensor. When the vacuum is applied, the gas flows through the nozzle, creating a pressure drop that is proportional to the square root of the pressure difference. The diffuser then slows down the gas flow, and the pressure sensor measures the pressure at the exit of the diffuser. The resulting data is then used to calculate the vacuum level within the system. This type of gauge is known for its high accuracy, wide measurement range, and ability to operate in various temperature and pressure conditions, making it suitable for applications such as vacuum chambers, semiconductor manufacturing, and scientific research.
