Report Overview

Gaseous biofuels, such as biogas and biomethane, are renewable energy sources produced through the anaerobic digestion of organic materials like agricultural waste, food scraps, and animal manure, or via gasification of biomass. These fuels are considered carbon-neutral because the CO₂ released during combustion is offset by the CO₂ absorbed during the growth of the feedstock. Biogas primarily consists of methane (50-70%) and CO₂, while biomethane is upgraded biogas with impurities removed to meet natural gas pipeline standards, making it interchangeable with fossil natural gas. Gaseous biofuels are used for electricity generation, heating, and transportation, offering a sustainable alternative to fossil fuels by reducing greenhouse gas emissions and leveraging waste-to-energy processes. Their adoption is driven by environmental policies, energy security concerns, and advancements in production and purification technologies.
