Report Overview

GDL, or Gas Diffusion Layer, for PEM (Proton Exchange Membrane) Fuel Cells is a critical component in the fuel cell stack. It is a porous, non-woven fabric that serves multiple purposes within the fuel cell system. Primarily, the GDL ensures uniform distribution of reactant gases (hydrogen and oxygen) across the surface of the catalyst layer, thereby enhancing the efficiency of the electrochemical reactions that generate electricity. Additionally, it provides mechanical support to the membrane electrode assembly and aids in heat and water management by facilitating the removal of excess water and dissipating heat generated during operation. The GDL is typically made from materials such as carbon paper or carbon cloth, which offer good electrical conductivity, chemical stability, and gas permeability. Its design and material selection are crucial for the overall performance, durability, and cost-effectiveness of PEM fuel cells, which are widely used in applications ranging from transportation to stationary power generation.
