## Abstracts

Gene therapy for sickle cell disease is a treatment that aims to correct the genetic mutation responsible for producing abnormal hemoglobin, which leads to sickle-shaped red blood cells. This process involves extracting the patient's hematopoietic stem cells, introducing a functional copy of the  $\beta$ -globin gene to restore normal hemoglobin production, and reinfusing the modified cells back into the patient. The goal is to alleviate symptoms and complications of the disease, such as pain crises and anemia, potentially offering a long-term cure for affected individuals.

The global Gene Therapy For Sickle Cell Disease market size was estimated at USD 1200.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 25.80% during the forecast period.
