Abstracts

Genetic Screening for Carrier Diseases refers to detecting whether an individual carries the causative gene of a certain genetic disease. In human genetics, some diseases are caused by recessively inherited gene mutations. These mutations usually do not cause the disease in the individual themselves, but if two carriers have offspring, they may increase the risk of the offspring suffering from the genetic disease. Genetic screening for genetic disease carriers can help individuals, especially couples planning to have children, by helping to assess the risk of their future offspring developing specific genetic diseases. If both partners are carriers, they are more likely to have offspring with the disease. Through this screening, couples can better understand their genetic status, make more informed reproductive decisions, and seek genetic counseling and medical intervention when needed.

The global Genetic Screening For Carrier Diseases market size was estimated at USD 3850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
