Report Overview

Genetically Engineered Vaccines for Livestock refer to a cutting-edge category of vaccines that utilize genetic engineering techniques to develop immunizations specifically tailored for the protection of livestock. These vaccines are designed by manipulating the genetic material of pathogens or by introducing specific genes into harmless vectors to stimulate an immune response in animals. The primary goal of these vaccines is to prevent, control, and eradicate infectious diseases in livestock populations, thereby safeguarding animal health, enhancing productivity, and ensuring food security. Genetically engineered vaccines offer several advantages, including increased efficacy, reduced side effects, and the potential for targeted protection against specific strains or serotypes of pathogens.
