Report Overview

Germanium-76 (Ge-76) is a radioactive isotope of the chemical element germanium, which has an atomic number of 32. It is a metastable isotope, meaning it is a nuclear isomer of the more stable Germanium-74 isotope. Ge-76 has a half-life of approximately 28.14 hours and decays primarily through electron capture, resulting in the emission of gamma radiation. This isotope is of interest in nuclear medicine and research due to its relatively short half-life and the gamma radiation it emits, which can be detected and measured for various applications such as tracer studies and cancer treatment. Germanium-76 is produced artificially, typically through neutron activation of stable germanium isotopes.
