Report Overview

Glass-filled polycarbonate (PC) is a high-performance thermoplastic composite material that combines the inherent strength, transparency, and impact resistance of polycarbonate with the enhanced stiffness, dimensional stability, and thermal resistance provided by glass fiber reinforcement. Typically, glass fibers make up 10-40% of the composite, improving mechanical properties such as tensile strength, flexural modulus, and creep resistance while retaining PC's lightweight nature and ease of processing. This material is widely used in automotive components, electrical and electronic housings, industrial machinery parts, and consumer goods where durability, heat resistance, and structural integrity are critical. The glass fibers also reduce thermal expansion, making it suitable for precision applications. However, the addition of fillers can reduce transparency and impact toughness compared to unfilled PC, requiring careful material selection based on application requirements.
