### Report Overview

A Glaucoma Implant, also known as a glaucoma drainage device or tube shunt, is a medical device designed to treat glaucoma, a group of eye diseases that damage the optic nerve and can lead to vision loss or blindness. This implant is typically used when other glaucoma treatments, such as medication and laser therapy, have failed to adequately control intraocular pressure (IOP). The device is surgically implanted into the eye to create a new drainage pathway for the aqueous humor, the fluid within the eye, thereby reducing IOP. Glaucoma implants can be categorized into various types based on their design, material, and mechanism of action, such as valved or non-valved implants. They are made from biocompatible materials like silicone or polymethyl methacrylate (PMMA) to ensure minimal risk of rejection or adverse reactions. The implant's effectiveness in managing IOP and preventing further optic nerve damage is crucial for preserving the patient's vision.
