Abstracts

Hexene-based polyethylene is a specific type of linear low-density polyethylene (LLDPE) in which 1-hexene serves as the comonomer during the copolymerization process with ethylene, resulting in a polymer with short-chain branching that enhances properties such as tensile strength, impact resistance, and environmental stress crack resistance compared to polyethylene produced with other commoners or through homopolymerization. This material is characterized by its versatility and is widely used in applications requiring durability and flexibility, such as heavy-duty sacks, stretch films, agricultural films, and geomembranes, with its performance attributes making it particularly suitable for high-performance packaging and industrial applications where mechanical robustness and processability are critical.
