Report Overview

2-Deoxy-D-glucose (2-DG) is a synthetic glucose analog that inhibits glycolysis by competitively binding to hexokinase, the first enzyme in the glycolytic pathway, thereby disrupting cellular energy production. Initially investigated for its potential antiviral and anticancer properties, it has gained attention as a metabolic inhibitor that selectively targets highly glycolytic cells, such as cancer cells and virus-infected cells. The compound has also been explored for its neuroprotective effects and potential applications in metabolic disorders. In recent years, its relevance has expanded due to research into its ability to modulate immune responses and its potential as an adjunct therapy in oncology and infectious diseases. The market for 2-DG is driven by increasing research in cancer therapeutics, antiviral drug development, and metabolic disease management, with growing interest from pharmaceutical companies and academic institutions. However, regulatory hurdles, competition from alternative therapies, and the need for extensive clinical validation pose challenges to its widespread adoption. The Asia-Pacific region, particularly India, has shown notable activity in 2-DG development, with some formulations receiving emergency use approvals for COVID-19 treatment, further influencing market dynamics.
