Abstracts

2-Fluoro-D-phenylalanine is a synthetic amino acid derivative characterized by the substitution of a fluorine atom at the ortho position of the phenyl ring in D-phenylalanine, resulting in altered biochemical properties such as enhanced metabolic stability and resistance to enzymatic degradation compared to its non-fluorinated counterpart. This structural modification makes it a valuable tool in scientific research, particularly in the fields of medicinal chemistry and pharmacology, where it serves as a building block for peptide-based drug development, a probe for studying enzyme mechanisms and substrate specificity, and a component in positron emission tomography (PET) imaging agents due to the presence of the fluorine-18 isotope when radiolabeled. Its utility stems from the ability to mimic natural amino acids while introducing steric and electronic perturbations that can modulate biological activity, protein interactions, and pharmacokinetic profiles, thereby facilitating the design of novel therapeutics and diagnostic agents with improved efficacy and selectivity.

The global 2 Fluoro D Phenylalanine market size was estimated at USD 42.85 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
