## Abstracts

A 2D imager barcode reader is an advanced optical device that captures and decodes two-dimensional barcodes, such as QR codes, Data Matrix, and Aztec codes, by using an image sensor to take a digital picture of the symbol and then processing it with sophisticated algorithms to extract the encoded information. Unlike traditional laser scanners, which rely on reflecting a light beam off one-dimensional barcodes, 2D imagers can read codes from any orientation, even if they are damaged, poorly printed, or displayed on screens, and they are capable of storing significantly more data, including URLs, images, and binary data, making them versatile for applications spanning retail, logistics, healthcare, manufacturing, and mobile ticketing.

The global 2D Imager Barcode Reader market size was estimated at USD 1680.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
