Abstracts

A 2D Scanning Rangefinder is a type of distance measurement device that uses laser technology to measure distances to objects in a two-dimensional plane. Unlike traditional rangefinders that measure the straight-line distance to a target, a 2D scanning rangefinder can provide information about the distance and the angle of the target in both horizontal and vertical dimensions, typically by scanning the environment in a sweep pattern. The 2D Scanning Rangefinder market is experiencing significant growth, driven by technological advancements and increasing demand across various industries such as automotive, robotics, security, and agriculture. One of the main factors contributing to this growth is the rise in autonomous systems, particularly self-driving vehicles and drones, which rely heavily on accurate distance measurement for navigation and obstacle detection. Moreover, the growing adoption of 2D LiDAR technology in robotics and industrial automation is increasing demand for rangefinders with high precision and fast scanning capabilities. As more industries adopt smart technology and automation, the need for reliable and efficient ranging devices is expanding. Additionally, applications in geographical mapping, surveillance, and agriculture are driving further growth. The market is expected to continue expanding as more applications are discovered, particularly with the development of cost-effective, compact, and highly accurate rangefinder devices.

The global 2D Scanning Rangefinder market size was estimated at USD 856.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.30% during the forecast period.
