Abstracts

A three-phase harmonic filter is an electrical device designed to mitigate harmonic distortion in three-phase power systems by suppressing or eliminating unwanted harmonic frequencies generated by non-linear loads, such as variable frequency drives, rectifiers, and other power electronics, thereby improving power quality, reducing energy losses, preventing equipment overheating, and ensuring compliance with regulatory standards such as IEEE 519 and IEC 61000. These filters operate by providing a low-impedance path to ground for specific harmonic frequencies, typically through passive components like inductors, capacitors, and resistors configured in series or parallel arrangements, and are categorized into types such as passive, active, and hybrid filters based on their design and application requirements.

The global 3 Phase Harmonic Filter market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
