Report Overview

The 30kW chassis dynamometer is a professional indoor testing equipment, which is mainly used to simulate the resistance of a car in actual driving and measure the performance of the car. The chassis dynamometer uses a roller simulation instead of a road surface to simulate the various resistances encountered by a car when driving at a normal constant speed, as well as the resistance encountered during acceleration and sliding. This simulation method allows the performance of the car to be accurately tested in an indoor environment. The 30kW chassis dynamometer refers to a maximum test power of 30 kilowatts. This means that it is suitable for testing cars with a power requirement of less than 30 kilowatts, covering a wide range of car types and test needs. The chassis dynamometer mostly uses a steel plate bending and welding integral body, which has good strength and beautiful appearance. At the same time, there is no need to install anchor bolts, and the wiring and air source are connected through connectors, which is very convenient for installation and debugging. The lifting adopts a single-beam airbag, which has good synchronization, maintenance-free, and refueling-free, further improving the convenience and reliability of the equipment.
