Abstracts

3,3,3-Trifluoropropene is a fluorinated olefin compound primarily used as a chemical intermediate in the synthesis of refrigerants, blowing agents, and specialty polymers, valued for its low global warming potential (GWP) and ozone-depleting potential (ODP) compared to traditional hydrofluorocarbons (HFCs). Its chemical structure, featuring a terminal double bond and three fluorine atoms on one carbon, makes it reactive and suitable for further functionalization in industrial processes, particularly in manufacturing hydrofluoroolefins (HFOs) like HFO-1234yf, which is widely adopted in automotive air conditioning systems due to stringent environmental regulations. The compound's properties align with global sustainability trends, driving its demand in applications requiring eco-friendly alternatives with reduced environmental impact.

The global 3,3,3 Trifluoropropene market size was estimated at USD 55.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
