## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 3A Molecular Sieve Activated Powder competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. 3A molecular sieve activated powder is a product obtained by high-temperature calcination of molecular sieve powder. During calcination, the powder loses most of its moisture, giving the activated powder strong adsorption capacity, good dispersibility, and rapid adsorption performance. It is commonly used as an adsorbent with selective adsorption properties in production processes, effectively removing trace amounts of moisture and impurities from materials, preventing bubble formation, and extending the material's lifespan. Especially in the production of polymers such as polyurethane, 3A molecular sieve activated powder can adsorb moisture and impurities that affect quality without altering the product's physicochemical properties. The upstream of 3A molecular sieve activated powder is mainly the chemical raw material industry, providing aluminum sources, silicon sources, and potassium hydroxide, among other raw materials; the downstream is widely used in paints and coatings, insulating glass sealant strips, petrochemical dehydration, and drying of new energy battery materials. In 2024, the global market price of activated 3A molecular sieve powder was US\$1,928 per ton, with sales of approximately 3.53 million tons. Global production capacity was 3.7-3.8 million tons, and the industry profit margin was 15-25%.

The global 3A Molecular Sieve Activated Powder market size was estimated at USD 6806.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
