## Abstracts

3D cell culture substrates are materials designed to support cell growth and organization in a three-dimensional environment, closely mimicking the natural conditions of tissues in vivo. Unlike traditional 2D cultures, these substrates provide more realistic cell-to-cell interactions and cell-matrix connections, enhancing cell viability and functionality. Common types of 3D cell culture substrates include hydrogels (such as gelatin, hyaluronic acid, and polyethylene glycol), which create a moist environment for cell growth; porous scaffolds that offer a framework for cell attachment and growth, often used in tissue engineering; and microfabricated platforms that utilize specific patterns or surface features to influence cell behavior. There are various products available on the market, including Corning's 3D cell culture platforms, Thermo Fisher's biomaterials, and MatTek's multifunctional culture matrices. These products are widely used in drug screening, disease modeling, and regenerative medicine, driving advancements in these fields. By utilizing 3D cell culture substrates, researchers can obtain experimental results that are more physiologically relevant, thereby improving the accuracy and effectiveness of their studies.

The global 3D Cell Culture Substrates market size was estimated at USD 1600.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.00% during the forecast period.
