Report Overview

In the 3D glass thermoforming process, the glass needs to be softened by high temperature heating and fixed in the mold to obtain the desired shape. Metal materials deform greatly and become soft at high temperature, while graphite has the characteristics of high hardness, good electrical conductivity, radiation protection, corrosion resistance, good thermal conductivity, low cost, and high temperature resistance. The temperature change of graphite and metal has opposite properties. The higher the temperature, the harder its body is. In this way, there will be no deformation problems. Therefore, the glass hot bending mold is made of graphite material, which can ensure the maximum precision, and the difficulty of mold processing is also reduced.
