Report Overview

The market for 3D IC (three-dimensional integrated circuits) and 2.5D IC (2.5-dimensional integrated circuits) is driven by the increasing demand for higher performance, miniaturization, and energy efficiency in semiconductor devices. 3D ICs stack multiple layers of silicon wafers or dies vertically, enabling faster data transfer and reduced power consumption by shortening interconnects, making them ideal for applications like high-performance computing, artificial intelligence, and advanced memory solutions. Meanwhile, 2.5D ICs use an interposer (typically silicon or organic) to connect multiple dies side-by-side on a single package, offering a balance between cost, performance, and thermal management, often used in GPUs, FPGAs, and networking chips. The market is expanding due to the rise of 5G, IoT, and data centers, with key players including TSMC, Intel, Samsung, and ASE Group investing heavily in advanced packaging technologies. However, challenges such as high manufacturing complexity, thermal management, and yield issues may hinder growth. The increasing adoption of heterogeneous integration and chiplet-based designs is expected to further propel the market, with projections indicating strong growth in the coming years.

The global 3D Ic And 2.5D Ic market size was estimated at USD 5005.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
