Report Overview

An image sensor or imager is a sensor that detects and conveys information used to make an image. It does so by converting the variable attenuation of light waves (as they pass through or reflect off objects) into signals, small bursts of current that convey the information. The waves can be light or other electromagnetic radiation. Image sensors are used in electronic imaging devices of both analog and digital types, which include digital cameras, camera modules, medical imaging equipment, night vision equipment such as thermal imaging devices, radar, sonar, and others. As technology changes, digital imaging tends to replace analog imaging.

The global 3D Imaging Sensor market size was estimated at USD 3069.70 million in 2023 and is projected to reach USD 4927.89 million by 2032, exhibiting a CAGR of 5.40% during the forecast period.
