Abstracts

3D line laser profilometer is an advanced optical measuring tool specially designed to obtain 3D profile information of object surface quickly and accurately. It is based on line structured light scanning technology, by emitting one or more laser lines to the target object, when the laser line contacts with the object surface and reflects back to the sensor, according to the deformation of the laser line on the object, combined with the principle of triangulation, the height change of the object surface relative to the reference plane can be calculated, so as to obtain the three-dimensional contour data of the object.

The global 3D Line Laser Profilometer market size was estimated at USD 289.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
