Abstracts

A 3D Multibeam Echosounder is a sophisticated hydrographic survey instrument that utilizes multiple sonar beams arranged in a fan-shaped array perpendicular to the direction of travel to collect high-resolution, three-dimensional bathymetric data of the seafloor or other underwater surfaces. By emitting sound pulses across a wide swath and precisely measuring the time and angle of their return, the system generates dense, accurate point clouds that can be processed into detailed digital elevation models, contour maps, or volumetric calculations. These systems are distinguished from single-beam or traditional multibeam echosounders by their ability to capture full 3D spatial information, including not only depth but also the shape, texture, and features of submerged structures, making them essential for applications requiring comprehensive underwater mapping, such as offshore construction, pipeline and cable route surveys, dredging operations, archaeological site documentation, and habitat mapping.

The global 3D Multibeam Echosounder market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
