Abstracts

The market for 3D printed medicinal tablets refers to the commercial landscape surrounding the production, distribution, and application of pharmaceutical tablets manufactured using additive manufacturing (3D printing) technologies, which enable the fabrication of solid dosage forms layer-by-layer from digital designs using drug-loaded materials such as polymers, hydrogels, or powder blends. This market encompasses the development of specialized 3D printers, printable pharmaceutical "inks" or filaments, associated software for dose and release customization, and regulatory frameworks governing their approval and use. Key applications include personalized medicine (e.g., polypills with multiple active ingredients, tailored dosages, or patient-specific release profiles), on-demand production in hospitals or pharmacies, and the fabrication of complex drug delivery systems (e.g., tablets with intricate internal structures for controlled or delayed release) that are difficult or impossible to achieve with conventional compression-based manufacturing.

The global 3D Printed Medicinal Tablet market size was estimated at USD 62.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.80% during the forecast period.
