Report Overview:

3D printing, also known as additive manufacturing, is different from the subtractive processing technology. It is based on the patient's X-ray computed tomography or magnetic resonance imaging to establish a CAD model (Computer aided design, CAD). It needs modern technologies such as electron beam technology and material science, and starts from the CAD model of the part, and realize the construction of three-dimensional complex entities by positioning the stacked materials layer by layer. Approximately 13% of all 3D printing revenues come from the medical industry. Orthopedic implants are the first medical application field where 3D printing technology is industrialized.

Because the 3D orthopedic implant printing technology can customize the shape of the implant according to the needs of the patient, and can precisely control the complex microstructure of the implant, it can realize the dual adaptation of the shape and mechanical properties of the implant to the human bone. Therefore, it is favored in the field of orthopedic implants and developed rapidly. At present, the research on the metal raw materials of 3D printing orthopedic implants mainly focuses on titanium and titanium alloys. Hot metal materials that have emerged in recent years, such as tantalum, magnesium, zinc, etc., are still in the research stage due to their imperfect material properties and have not yet been clinically applied.

The Global 3D-Printed Orthopedic Implants Market Size was estimated at USD 2033.30 million in 2023 and is projected to reach USD 5005.39 million by 2029, exhibiting a CAGR of 16.20% during the forecast period.
