## Abstracts

### Report Overview:

Aluminium is 3D printed using the DMLS (Direct Metal Laser Sintering) or SLM process. A very fine metal powder is melted with a laser to produce your design layer by layer. Once your design is complete any support structures are removed and any finishing completed. Unused powder is recycled for use on the next model.

3D Printing in Aluminium can work out more cost effective than traditional 'subtractive' processes, especially where you have complex or intricate designs. Extra complexity does not add to the price of manufacture as it might with traditional manufacture.

The Global 3D Printing Aluminum Market Size was estimated at USD 179.14 million in 2023 and is projected to reach USD 498.54 million by 2029, exhibiting a CAGR of 18.60% during the forecast period.
