Abstracts

3D printed food is a process of pre-processing (such as mixing and extruding) food materials into a layered structure through 3D printing technology (additive manufacturing technology), and then building it layer by layer according to the design model. Compared with traditional manufacturing technology, 3D printed food is highly personalized and customized, and can adjust the shape, taste, ingredients and even nutritional structure according to needs. It uses food materials as raw materials and processes them layer by layer through a special 3D printer to form complex and customized food.

The global 3D Printing Food Machine market size was estimated at USD 290.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.00% during the forecast period.
