Abstracts

3D printing technology is a new type of printing technology. Its outstanding advantage is that it can directly generate parts of any shape from computer graphics data without mechanical processing or any molds, thereby greatly shortening the product development cycle, improving productivity and reducing production costs. 3D printing metal powder is the most important raw material for 3D printing of metal parts, and its preparation method has attracted much attention. 3D printing metal powder is the most important link in the 3D printing industry chain of metal parts and also the greatest value. This report mainly studies the 3D printing iron powder market. 3D printing requires huge investment. Many companies have invested huge amounts of capital, but the income is meager and they cannot make a profit in the long run. In recent years, many manufacturers have been acquired by giant companies, such as Arcam AB acquired by GE and LPW Technology acquired by Carpenter Technology. In the future, capital barriers and technical barriers will cause companies that do not have cost advantages and scale advantages to be eliminated by the market. The development of new technologies such as 5G, business intelligence, and cloud will create more favorable conditions and environment for the development of 3D printing metal powders; embracing the era of intelligence is the only way for companies. Due to the rapid development of new technologies, companies that produce 3D printing metal powders should always be vigilant and keep pace with the times, otherwise they will face elimination. In the future development of the 3D printing metal powder industry, it is not ruled out that major technological innovations will occur, leading to major changes in the process flow, and it is not ruled out that new products or materials with more cost or performance advantages will appear, which will achieve major substitution for related products. If the company cannot adapt to the trend and face changes, some of the company's products will lose market demand.

The global 3D Printing Iron Powder market size was estimated at USD 289.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.60% during the forecast period.
