Report Overview

3D Printing Pellet Extruder sometimes known as fused granulate fabrication (FGF), is a variant of fused deposition modeling (FDM, or FFF for fused filament fabrication) that uses pellets as feedstock instead of filament.

Although filament is suitable for most 3D printing applications, pellet 3D printing has carved out a niche in prototyping and large-format printing, where it can offer important advantages such as lower costs and faster builds.

To use pellets as feedstock, however, one needs a special type of extruder different from the kind found on an FDM printer.

Pellet 3D printing borrows aspects from both FDM and plastic forming processes like injection molding. Like FDM, it builds up parts layer by layer by extruding molten material from a nozzle attached to a computer-controlled printhead.

Where it differs from FDM, and where it more closely resembles injection molding, is the way it feeds raw material to the nozzle, which it does via a screw and barrel system. In this system, pellets are gravity-fed from a hopper into a heated barrel, where they are melted down and forced towards a nozzle by a reciprocating screw (or auger).

This report provides a deep insight into the global 3D Printing Pellet Extruder market covering all its essential aspects.
