Abstracts

3D Sensors is an object whose purpose is to detect events or changes in its environment, and then provide a corresponding output. A sensor is a type of transducer; sensors may provide various types of output, but typically use electrical or optical signals. For example, a thermocouple generates a known voltage (the output) in response to its temperature (the environment). A mercury-in-glass thermometer, similarly, converts measured temperature into expansion and contraction of a liquid, which can be read on a calibrated glass tube.

The global 3D Sensor market size was estimated at USD 7487.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.15% during the forecast period.
