Abstracts

3D structured light scanner is a device used to capture the precise shape and geometry of an object by projecting a pattern of light (usually stripes or grids) onto its surface. As the light interacts with the object, the patterns deform based on the object's contours. Cameras or sensors then record these distortions, and specialized software analyzes them to reconstruct a detailed three-dimensional model of the object. These scanners are highly accurate and commonly used in industries like manufacturing, healthcare, and cultural heritage for tasks such as quality inspection, reverse engineering, and artifact digitization.

The global 3D Structured Light Scanners market size was estimated at USD 310.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
